# Bitcoin Scripting Report
## CS 216: Introduction to Blockchain
## Assignment 2

**Team Members->**

Arihant Jain - 230001009

Bhuva Vasudha -  230002017

Tanishq Godha - 230001074

Vedant Jain - 230008038

---

# 1. Introduction

The purpose of this assignment is to understand Bitcoin transactions using Legacy (P2PKH) and SegWit (P2SH-P2WPKH) address formats. We implement scripts to create, sign, and analyze transactions in both formats and compare their efficiency.

---

# 2. Legacy (P2PKH) Transactions

**Overview:**

- **Funding Address A:**

    - **Address:** mh2m5vTZaX9T9AGHYtBCAPqRuXLnNvLV4X
    - **Funded Amount:** 0.01 BTC
- **Transaction from A to B:**

    - **TXID:**
      509e43e60972daa74dedb17108251dd9055fbaeb79d8d230c8ef17db8344
      b448
    - **B's Address:** mwbtAq1kFJdieQFh4bHJQQW4mofu4HLBjA

- **Transaction from B to C:**

  - **TXID:** <span>f3b6e3e25b8c16100f41eb954803aad202cabb3b52d463456090f93d5defc088</span>
  - **C's Address:** mn5RDGXhXrgyLEjMaaKscm9Y3tQa8DNwYf

---

Verifying legacy input spending c449c2c51dd4e85957e60260d44859f121003cdc98f3db8dedcbbcdf99328f3e:0

  Expected HASH160 (from locking script): c3c1d8018c0b101826c6713ad7409a223646f802

  Computed HASH160 (from unlocking script): c3c1d8018c0b101826c6713ad7409a223646f802

  Verification PASSED for this legacy input.

# Challenge and Response Scripts:

They are of this format:

- **Locking Script (Challenge):**
  `OP_DUP OP_HASH160 <Public Key Hash> OP_EQUALVERIFY OP_CHECKSIG`
- **Unlocking Script (Response):**
  `<Signature> <Public Key>`

# Validation Process:

The unlocking script generates a HASH160 from the provided public key. This computed HASH160 must match the public key hash specified in the locking script. For example, in the transaction from B to C, the expected and computed HASH160 values are identical, validating the transaction.

# Screenshots & Debugging:

Here are the outputs from the btcdeb debugger we ran on windows: (It finally shows a 1(True)) in the stack which indicates that the transaction was properly validated.

  Verification PASSED for this segwit input.

All transactions completed.

# Challenge and Response Scripts:

- **Locking Script (Challenge):**
  For SegWit P2WPKH, the locking script is:
  `0 <Public Key Hash>`
- **Unlocking Script (Response) – Witness Data:**
  `[Signature, Public Key]`

# Validation Process:

In SegWit transactions, validation is performed by:

1. Extracting the witness data (signature and public key).
2. Computing the HASH160 of the provided public key.
3. Comparing the computed hash with the public key hash in the locking script. For example, in Transaction A → B, the HASH160 computed from the witness public key matches the one in the locking script, thereby validating the transaction.

# Screenshots & Debugging:

Here are the outputs from the btcdeb debugger we ran on windows: (It finally shows a 1(True)) in the stack which indicates that the transaction was properly validated.

# 4. Comparison & Analysis

| Feature | P2PKH (Legacy) | P2SH-P2WPKH (SegWit) |
|---------|----------------|----------------------|

| | | |
|---|---|---|
| Transaction Size | Larger | Smaller |
| Script Structure | Uses `ScriptSig` | Uses witness field |
| Security | Vulnerable to malleability | Malleability-resistant |
| Efficiency | Less efficient | More efficient |

## 4.1 Why SegWit is Better

- **Reduces transaction size**, lowering fees.
- **Eliminates malleability**, improving multi-signature setups.
- **Enables second-layer solutions** like the Lightning Network.

Here is a screenshot of comparison of sizes of the two types of transactions:

```
